

SAHIL KUTTE

Backend Software Engineer | Java | Spring Boot | Microservices

9545538873 | kuttisahil@gmail.com | linkedin.com/in/sahil-kutte-42a18642a | github.com/sahilkutte/algo-treading-platform

PROFESSIONAL SUMMARY

Backend Software Engineer with 3+ years of experience building Java and Spring Boot applications, REST APIs, microservices and event-driven systems. Experienced in designing production APIs, service-oriented architecture, external integrations, real-time systems, caching and database optimization. Strong hands-on experience with scalable backend design and algorithmic trading systems.

TECHNICAL SKILLS

Languages	Java 8/17/21, SQL
Backend	Spring Boot, Spring Data JPA, Hibernate, REST APIs, Microservices
Messaging / Real-time	WebSocket, Kafka, RabbitMQ, Event-driven architecture
Databases	MySQL, Oracle, H2
Cloud / DevOps	AWS, Docker, Kubernetes, Helm, Jib, Maven
Tools	Git, Azure Repos, Postman, SonarQube, IntelliJ IDEA
Engineering	Concurrency, caching, API design, JWT/OAuth, system design

PROFESSIONAL EXPERIENCE

Backend Software Engineer / Spring Developer | Riomed Technologies India Private Limited | 10 May 2023 – Present

- Developed and maintained 150+ production REST APIs using Java, Spring Boot, Spring Data JPA and Hibernate.
- Worked on microservices and service-oriented architecture, including migration of monolithic functionality toward SOA-based services.
- Implemented backend modules for medical-domain applications involving medication, patient clinical records, referrals and document management.
- Designed APIs for large document uploads and retrieval, including chunked file processing and temporary-file lifecycle management.
- Integrated Microsoft Graph APIs for Teams/calendar functionality and resolved timezone-related backend issues.
- Worked with Kafka, RabbitMQ and event-driven processing while investigating concurrency, asynchronous processing and Java NIO production issues.
- Applied database indexing, caching, connection-pool tuning and query optimization to improve backend performance and reduce unnecessary database access.
- Used Git, Maven, Postman, SonarQube and Azure Repos throughout development and production support.

FEATURED PROJECT

Algorithmic Trading Platform | Java, Spring Boot, WebSocket, Upstox Market Data, MySQL

- Designed an event-driven trading architecture covering real-time market data, strategy execution, risk management, order execution, positions and P&L;.
- Integrated broker market data through WebSocket and implemented Protobuf feed decoding to convert broker updates into application-level MarketTick events.
- Built an instrument master repository supporting lookup by instrument key, trading symbol, underlying and expiry for efficient option-chain operations.
- Implemented ATM option selection using underlying spot price and option-chain data, with dynamic subscription to required F&O; instruments.
- Designed thread-safe market-data caching using ConcurrentHashMap and separated market-data ingestion from strategy processing using event-driven dispatch.
- Implemented Strategy, StrategyContext and OrderExecution abstractions to decouple trading strategies from execution mechanisms.
- Built paper order execution, position management, risk validation and P&L; tracking; live broker execution and production hardening are ongoing.

SELECTED ENGINEERING HIGHLIGHTS

- **Concurrency:** Used thread-safe collections and applied Java memory-model concepts including synchronized, volatile, locks and atomic operations.
- **Performance:** Worked with HikariCP connection pools, database indexes, caching strategies and high-volume data access.
- **API Design:** Experienced with DTOs, validation, JWT-based authentication, Spring annotations and clean service/repository separation.
- **System Design:** Hands-on design of event-driven processing, WebSocket communication, service interfaces and broker integrations.

CURRENT FOCUS

Building production-oriented capabilities for the algorithmic trading platform, including robust risk management, trade persistence, order lifecycle handling, live execution, reconciliation, monitoring and backtesting.
